

1. (1). Integral closure of \mathbb{Z} in \mathbb{C}

(2). If R is a UFD

$$\forall a, b \in R, \text{ sps. } a = u p_1^{e_1} \dots p_t^{e_t} \quad b = v p_1^{f_1} \dots p_t^{f_t}$$

where $e_i, f_i \geq 0$, $u, v \in U(R)$, p_i are primes

claim. $d = \prod_{i=1}^t p_i^{\min\{e_i, f_i\}}$ is the gcd of a, b

1°. $d \mid a$ and $d \mid b$

2°. if for some $g \in R$ s.t. $g \mid a$ and $g \mid b$

then we can write g into $g = w \cdot p_1^{h_1} \dots p_t^{h_t}$

where $w \in U(R)$ and $h_i \leq \min\{e_i, f_i\}$

i.e. $g \mid d$

from 1°, 2°, d is the GCD of a and b .

If $\forall a, b \in R$, $\gcd(a, b)$ exists. Since R satisfies chain condition, only need to prove R satisfies prime condition.

i.e. if p is irreducible element in R , then p is a prime.

Now take $p \in R$ s.t. p is irreducible.

we need to prove. $\forall a, b \in R$. if $p \mid ab$ then $p \mid a$ or $p \mid b$

Now given $p|ab$

1°. if $(p, a) = p$, then $p|a$

2°. if $(p, a) \neq p$, then $(p, a) = 1$. since p is irreducible.

Sp. $(p, ab) = d$. then $b|d$

Let $d = ub$ and $d|pb$, $\exists g \in R$ s.t.

$$pb = gd \quad \therefore pb = gub \Rightarrow p = gu$$

Similarly, $\exists f \in R$ s.t. $fd = ab \Rightarrow a = fu$

$(a, p) = 1$, $u|a$ and $u|p \Rightarrow u$ is a unit

$\Rightarrow (p, ab) = b$ since $p|pb$, $p|ab \Rightarrow p|b$ \square

2. 11. To prove $S^{-1}R$ is a UFD. we need to prove $S^{-1}R$

satisfies: it is a ID and

1° Chain condition 2° prime condition.

The reference answers is too omitted. To solve this question we need some claim:

Construction: Let S be the multiplicatively closed set and since R is a UFD, $\forall a \in S$, $a = up_1^{e_1} \dots p_r^{e_r}$

Let T be the set of all such p_i , i.e

Let T be the set of all irreducibles that divide an element

in S .

and let M be the set of all irreducibles that not in T

Claim 1: $p \in T$ iff $(p, 1)$ in $S^{-1}R$ is a unit.

proof: $p \in T \Rightarrow \exists s \in S$ s.t. $p|s$

$$\Rightarrow \exists x \in R \text{ s.t. } px = s \cdot 1$$

$$\Rightarrow \frac{p}{1} \cdot \frac{x}{s} = \frac{px}{s} = \frac{px}{px} = 1 \in S^{-1}R$$

so $(p, 1)$ is a unit in $S^{-1}R$

If $(p, 1)$ is a unit in $S^{-1}R$

$$\text{then } \exists t \in S \text{ and } y \in R \text{ s.t. } \frac{p}{1} \cdot \frac{y}{t} = 1 \in S^{-1}R$$

i.e. $py = t$ in R it shows $p|t$ where $t \in S$

so $p \in T$.

Claim 2: $p \in M$ then $(p, 1)$ is irreducible in $S^{-1}R$

We proof by contradiction.

$$\text{Sps. } \frac{p}{1} = \frac{xy}{ss'} = \frac{x}{s} \cdot \frac{y}{s'} \text{ in } S^{-1}R$$

then $ps s' = xy$ in R , i.e. $p|xy$.

since R is UFD, p irreducible. $\Rightarrow p$ prime

$\Rightarrow p|x \text{ or } p|y$

Since $p \nmid T$, $p \nmid ss'$

it shows p appears once in the irre. decomp. in xy

i.e. $p|x$ or $p|y$ but $p \nmid (x,y)$

claim 3.

if (p,s) are in $S^{-1}R$

then p are in R

i.e. x or y in S

i.e. $\frac{x}{s}$ or $\frac{y}{s'}$ is a unit in $S^{-1}R$

proof: if not

suppose $p = p_1 p_2$, $p_1, p_2 \notin U(R)$

$$\text{then } \frac{p}{s} = \frac{p_1}{s} \frac{p_2}{s}$$

Since $\frac{p}{s}$ irre, not unit

$\Rightarrow p \in M$ by claim 1

$\Rightarrow p_1, p_2 \neq s$

$\Rightarrow \frac{p_1}{s}, \frac{p_2}{s}$ not unit in

and $\frac{x}{s} \frac{y}{s'} = 0$ iff either x or $y = 0$

so $S^{-1}R$ is a ID

Step 2: $\forall (x,s) \in S^{-1}R$, $x = u p_1^{e_1} \dots p_t^{e_t}$

$$\text{then } \frac{x}{s} = \frac{u}{s} \cdot \underbrace{\left(\frac{p_1}{s}\right)^{e_1} \dots \left(\frac{p_t}{s}\right)^{e_t}}$$

some are units, some are irreducibles

it shows $S^{-1}R$ satisfies factor chain condition.

Step 3. \forall irreducible element (p, s) in $S^{-1}R$

by claim 3. p irred. in R and $p \in M$

so if $(p, s) \mid (x, s_1)(y, s_2)$

it shows $\exists \frac{r}{t} \in S^{-1}R$ s.t. $\frac{p}{s} \cdot \frac{r}{t} = \frac{x}{s_1} \cdot \frac{y}{s_2}$

i.e. $pr s_1 s_2 = s t x y$ $q \in M$, $s, t \in S$

then $p \mid xy \Rightarrow p \mid x$ or $p \mid y$

WLOG. Let $p \mid x$, $\exists x' \in R$ s.t. $x'p = x$

$$\Rightarrow \frac{x}{s_1} = \frac{x'p}{s_1} = \frac{x'ps}{s_1 s} = \frac{p}{s} \cdot \frac{x's}{s_1}$$

i.e. $(p, s) \mid (x', s_1)$

i.e. if $p \mid x$, $(p, s) \mid (x, s_1)$
if $p \mid y$, $(p, s) \mid (y, s_2)$ $\Rightarrow (p, s)$ is prime in $S^{-1}R$.

Therefore. $S^{-1}R$ also satisfies prime condition.

I must say, this is not "hard", just a bit tedious.

Remember, "check by definition" is trivial work.

(2). $\mathbb{Z}[\sqrt{5}]$ is not a UFD, regard it as subring of \mathbb{C}

where \mathbb{C} is a field, \mathbb{C} is a UFD.

(3). take $\mathbb{Z}[x]$ as a UFD and (x^2+1) is its prime ideal.

$\mathbb{Z}[x]/(x^2+1) \subset \mathbb{Z}[i]$ shows $\mathbb{Z}[x]/(x^2+1)$ is not UFD.

3. (1). Let $n \in \mathbb{Z}$, $f \in \mathbb{Z}[x]$, $\deg f \geq 1$

$\mathbb{Z}[x]/(n) = \mathbb{Z}_n[x]$, not field \Rightarrow (n) not maximal.

if constant of f in \mathbb{Q} , $(f) \subset (x) \subset (\mathbb{Z}, x)$, not maximal.

if constant of f is not 0, $(f) \subset (p, f)$ for some prime p .
not maximal.

(2).

Let p be prime in R . R is PID

Sp3 $(p) \subseteq (m) \subseteq R$

$\Rightarrow p \in (m) \Rightarrow \exists r \in R \quad p = mr$

Since p prime, plm or plr

if plm , $(p) = (m)$

if plr , m is a unit $\Rightarrow (m) = R$

$\Rightarrow (p)$ is maximal.

\Rightarrow

4. (1). if $a_0 = 0$, $\forall g \in k[[x]]$

$\deg fg \geq 1 \Rightarrow f$ is not invertible.

\Leftarrow if $a_0 \neq 0$

$$\text{set } f^{-1} = a_0^{-1} \left(1 + \sum_{j=1}^{\infty} \left(-\sum_{i=1}^j \frac{a_i}{a_0} x^i \right) x^j \right) \in k[[x]]$$

then you can check $ff^{-1} = 1 \Rightarrow f$ invertible.

(2). If $I \subseteq k[[x]]$

1° if $\exists f \in I$ s.t. $a_0 \neq 0$, then $I = (1)$

2° if $\forall f \in I$ s.t. $a_0 = 0$

then take $N = \min \{ \deg f \mid f \in I \}$

$$I = (x^N)$$

5. if $(a, b) = (d)$ then $(a) \subseteq (d)$, $(b) \subseteq (d)$

i.e. $d \mid a$ and $d \mid b$

sps $\exists f$ s.t. $f \mid a$ and $f \mid b$

then $(d) = (a, b) \subseteq (f)$

it shows $f \mid d$ - so d is the greatest common divisor.

if d is the greatest common divisor.

since R is PID, $\exists r \in R$

s.t. $(a, b) = (r) \subseteq (d)$ i.e. $d \mid r$, but d is the

greatest common divisor it forces.

rld , i.e. $(\mathbb{D}) = (d)$

6. Why we can use Bezout's Thm?

Lemma: Let R be a PID.

$$d = \gcd(a, b) \Leftrightarrow \exists x, y \in R \text{ s.t. } ax + by = d.$$

\Leftarrow trivial.

\Rightarrow check by yourself!

Now, in R $d = \gcd(a, b)$

$$\Rightarrow \exists x, y \in R, \quad ax + by = d, \text{ and } R \subseteq D$$

regard a, b, x, y, d as elements in D

$$\text{i.e. } \exists x, y \in D, \quad ax + by = d$$

by our lemma, $d = \gcd(a, b)$ in D .

7. Since $[K : \mathbb{Q}] = 2$.

$$\forall \alpha \in K, \quad \text{Irr}(\alpha) \in \mathbb{Q}[x] \text{ s.t. } \deg(\text{Irr}(\alpha)) = 2.$$

i.e. take any $\beta \in \mathcal{O}_K$. $\deg(\text{Irr}(\beta)) = 2$ and

$\text{Irr}(\beta)$ is monic, integer coefficients poly.

Construct

$$(x - a - b\sqrt{d})(x - a + b\sqrt{d})$$

$$= x^2 - 2ax + a^2 - b^2d \in \mathbb{Z}[x]$$

$$\text{i.e. } \{a+b\sqrt{d} \mid a, b \in \mathbb{Z}\} \subseteq \mathcal{O}_K$$

Similarly if $d \equiv 1 \pmod{4}$ also you have

$$\left\{a+b\frac{1+\sqrt{d}}{2} \mid a, b \in \mathbb{Z}\right\} \subseteq \mathcal{O}_K.$$

Now for the other direction:

take $\alpha = a+b\sqrt{d}$ with $a, b \in \mathbb{Q}$ and sps α is an algebraic integer.

$$1^\circ \text{ if } b=0 \quad \alpha = a \in \mathbb{Q}$$

and α is a \wedge monic integer coefficient polynomial.
root of

it shows $a \in \mathbb{Z}$.

$$2^\circ. \text{ If } b \neq 0, \quad \alpha \text{ is root of } x^2 - 2ax + (a^2 - b^2 d)$$

$$\Rightarrow 2a \text{ and } a^2 - b^2 d \in \mathbb{Z}.$$

$$\Rightarrow 4a^2 - 4b^2 d \in \mathbb{Z}$$

$$\Rightarrow 4b^2 d \in \mathbb{Z}$$

$$\Rightarrow 2b \in \mathbb{Z}$$

$$\Rightarrow (2a)^2 - (2b)^2 d \equiv 0 \pmod{4}$$

Since $(2a)^2, (2b)^2 \pmod{4}$ only 0 and 1.

$$\textcircled{1}, \quad d \equiv 2, 3 \pmod{4}, \quad \Rightarrow (2a)^2, (2b)^2 \equiv 0 \pmod{4} \\ \Rightarrow a, b \in \mathbb{Z}$$

$$\textcircled{2}, \quad d \equiv 1 \pmod{4}$$

$$(2a)^2, (2b)^2 \equiv 0 \pmod{4}, \quad a, b \in \mathbb{Z}$$

$$\text{or}, \quad (2a)^2, (2b)^2 \equiv 1 \pmod{4}$$

$$\text{i.e. } \alpha \text{ is of the form } a + b \frac{1 + \sqrt{d}}{2} \text{ where } a, b \in \mathbb{Z}.$$

$$8. \text{ (1). take norm. } a^2 + 3b^2$$

$$(2). \text{ take norm. } |a^2 - 2b^2|$$

$$(3). \text{ take } w = \frac{1 + \sqrt{5}}{2}, \quad v = \frac{1 - \sqrt{5}}{2}$$

$$\text{take norm } |(a + bw)(a + bv)|$$

$$9. \text{ take norm. } a^2 + b^2$$

if $\gamma \in R$ invertible.

$$\|\gamma\| \leq 1 \quad \text{only } \{\pm 1, \pm i\}$$

10. this is number theory problem.
